Tulane University

Outline

- High prices for prescription drugs
- Cost-sharing after US health reform
- Cost Sharing for Rx: A Powerful Policy Lever to Use with Care

Costly new specialty drugs are a major driver of increased health spending

Same Drug, Higher Price

Here are prices the government health systems of England, Norway and Ontario, Canada, paid for some of the biggest brand-name drugs by Medicare Part B expenditure, for which pricing was available in multiple countries.

Price as a percentage of U.S. Medicare price in: ■ England ■ Norway ■ Ontario

Lucentis

Used for conditions including: macular degeneration

Medicare price: **\$1,936** for a 0.5 mg vial

— 100% (U.S. price) —

Eylea

Macular degeneration

\$1,930 for a 2 mg per 0.05 mL vial

Rituxan/MabThera

Rheumatoid arthritis

\$3,678 for a 500 mg vial

Neulasta

White blood cell deficiency during chemotherapy

\$3,620 for a 6 mg per 0.6 mL syringe

Avastin

Cancer

\$685 for a 100 mg vial

Prolia

Osteoporosis

\$893 for a 60 mg syringe

Alimta

Lung cancer

\$604 for a 100 mg vial

Velcade

Cancer

\$1,610 for a 3.5 mg vial

Herceptin

Breast cancer

\$858 per 100 mg

Eligard

Prostate cancer

\$217 for 7.5 mg

Note: Medicare beneficiaries are responsible for paying 20% of prices listed here. Medicare itself covers 80%. Prices listed reflect a temporary 2% discount imposed by federal spending cuts known as budget sequestration. All prices are for third quarter of 2015; foreign prices were converted to U.S. dollars at July 1, 2015, exchange rates. Top drugs were determined by Medicare Part B payments to doctors' offices and medical practices in 2013, the latest year for which data were available. Norwegian prices include 25% Value Added Tax levied on pharmaceuticals. England's National Health Service says prices listed here are 'indicative' and may vary in some circumstances.

Prescription Drug Cost Sharing

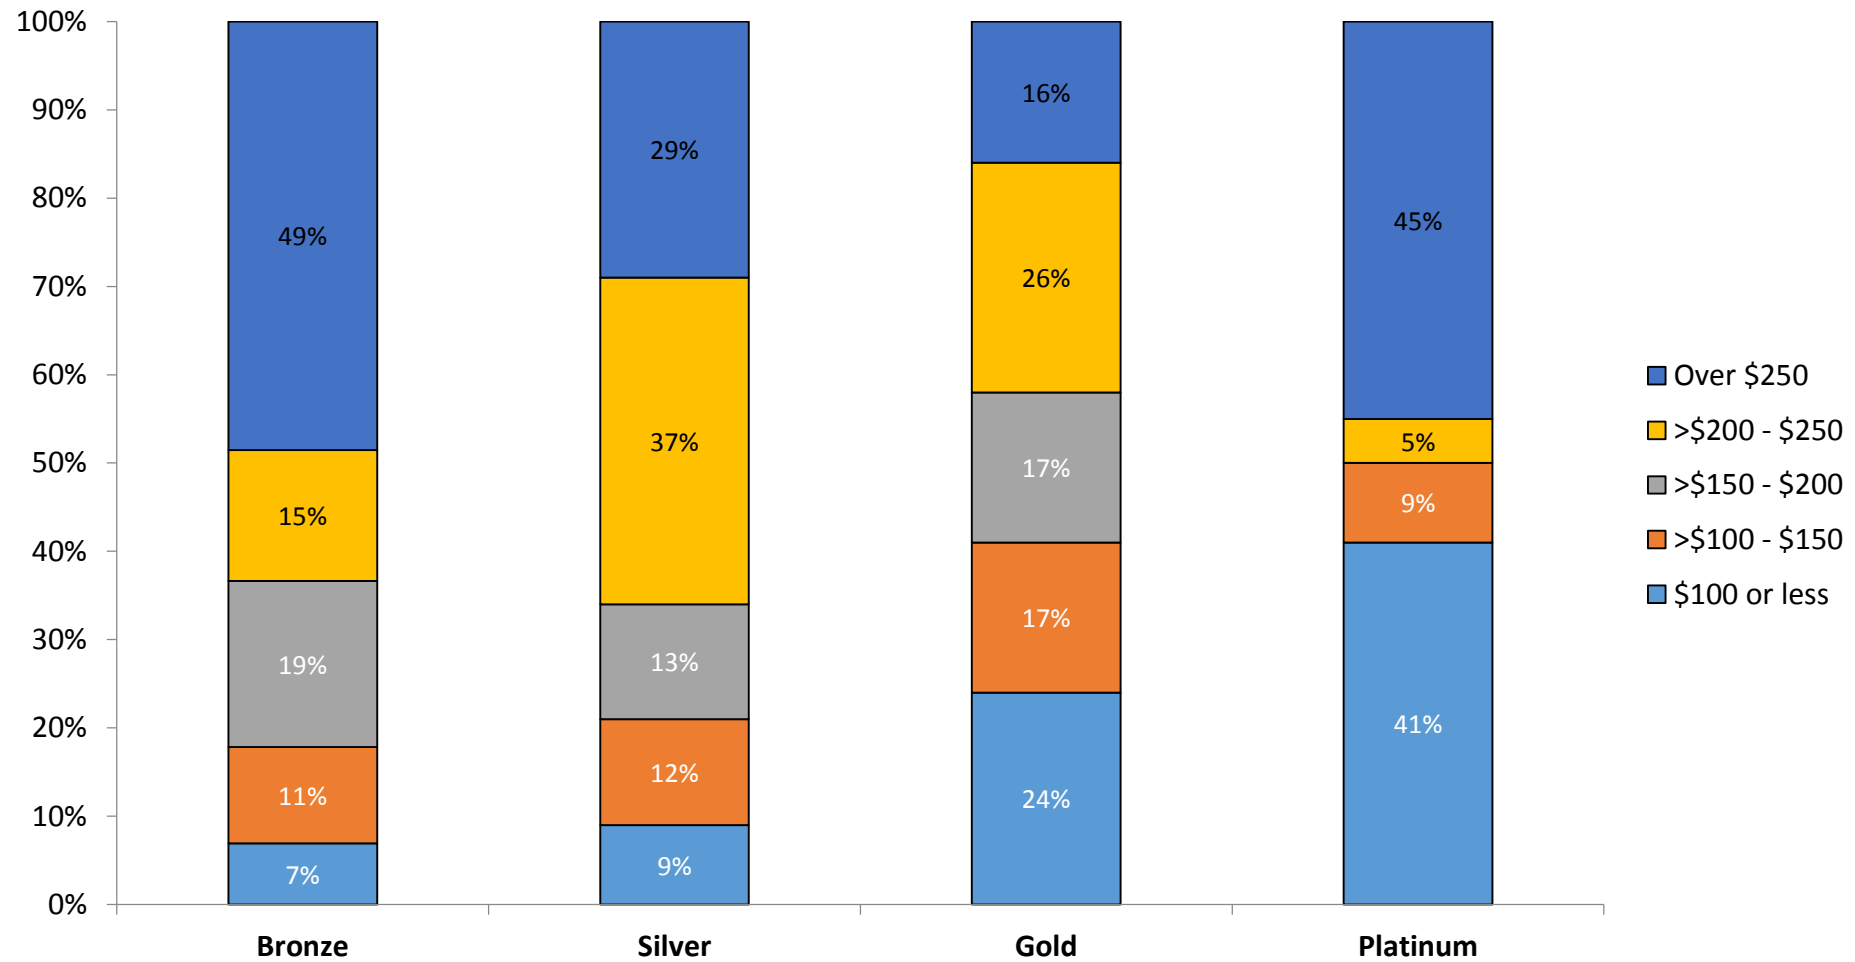

Cost sharing in the US

- Insurance plans typically require some form of cost sharing (also called out-of-pocket costs)
- These expenses, which are in addition to the amount an enrollee spends on his or her monthly premium, come in a variety of forms:
 - Copayments: set dollar amounts for covered services (e.g. \$20 per general physician visit)
 - Coinsurance: a percentage of the allowed cost for covered services (e.g. 20% of the allowed cost for a specialist visit)
 - Deductibles: set dollar amounts that enrollees must pay before their plan starts to cover the service or a group of services (e.g. \$200 drug deductible before drug coverage begins)
 - Often, some combination thereof.

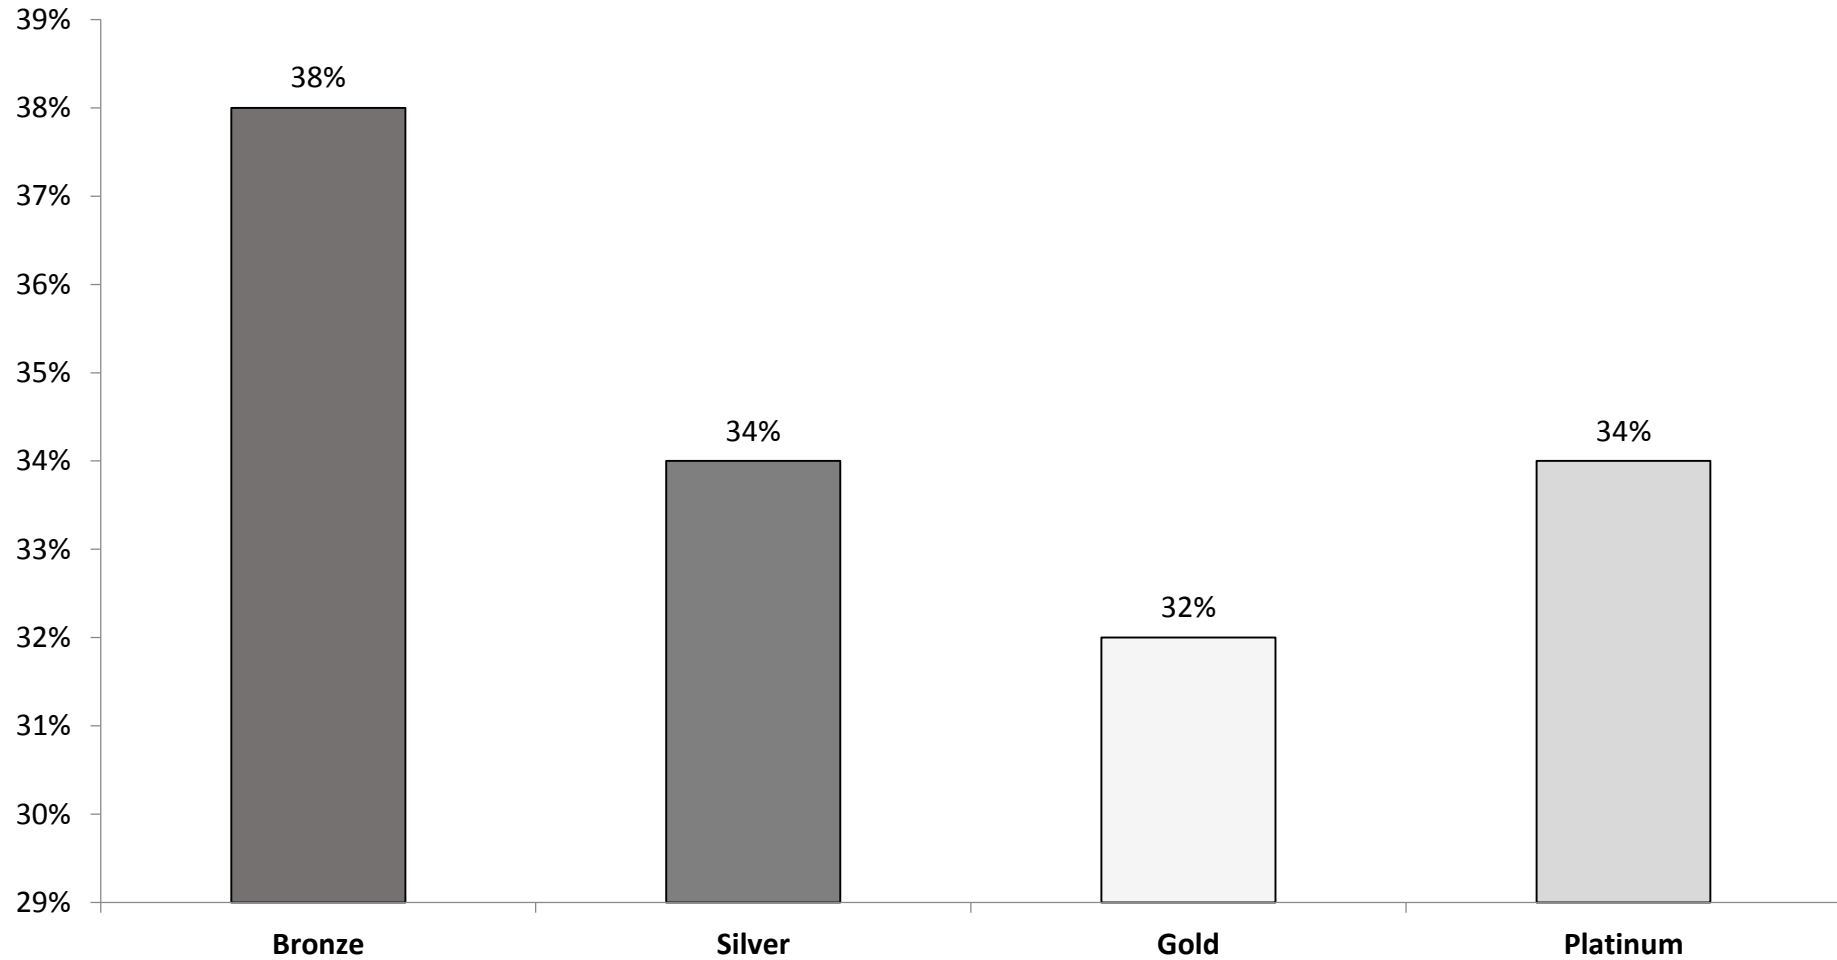

Average Copayment for Specialty Drugs (includes plans with 'copayment' or 'both copayment & coinsurance')

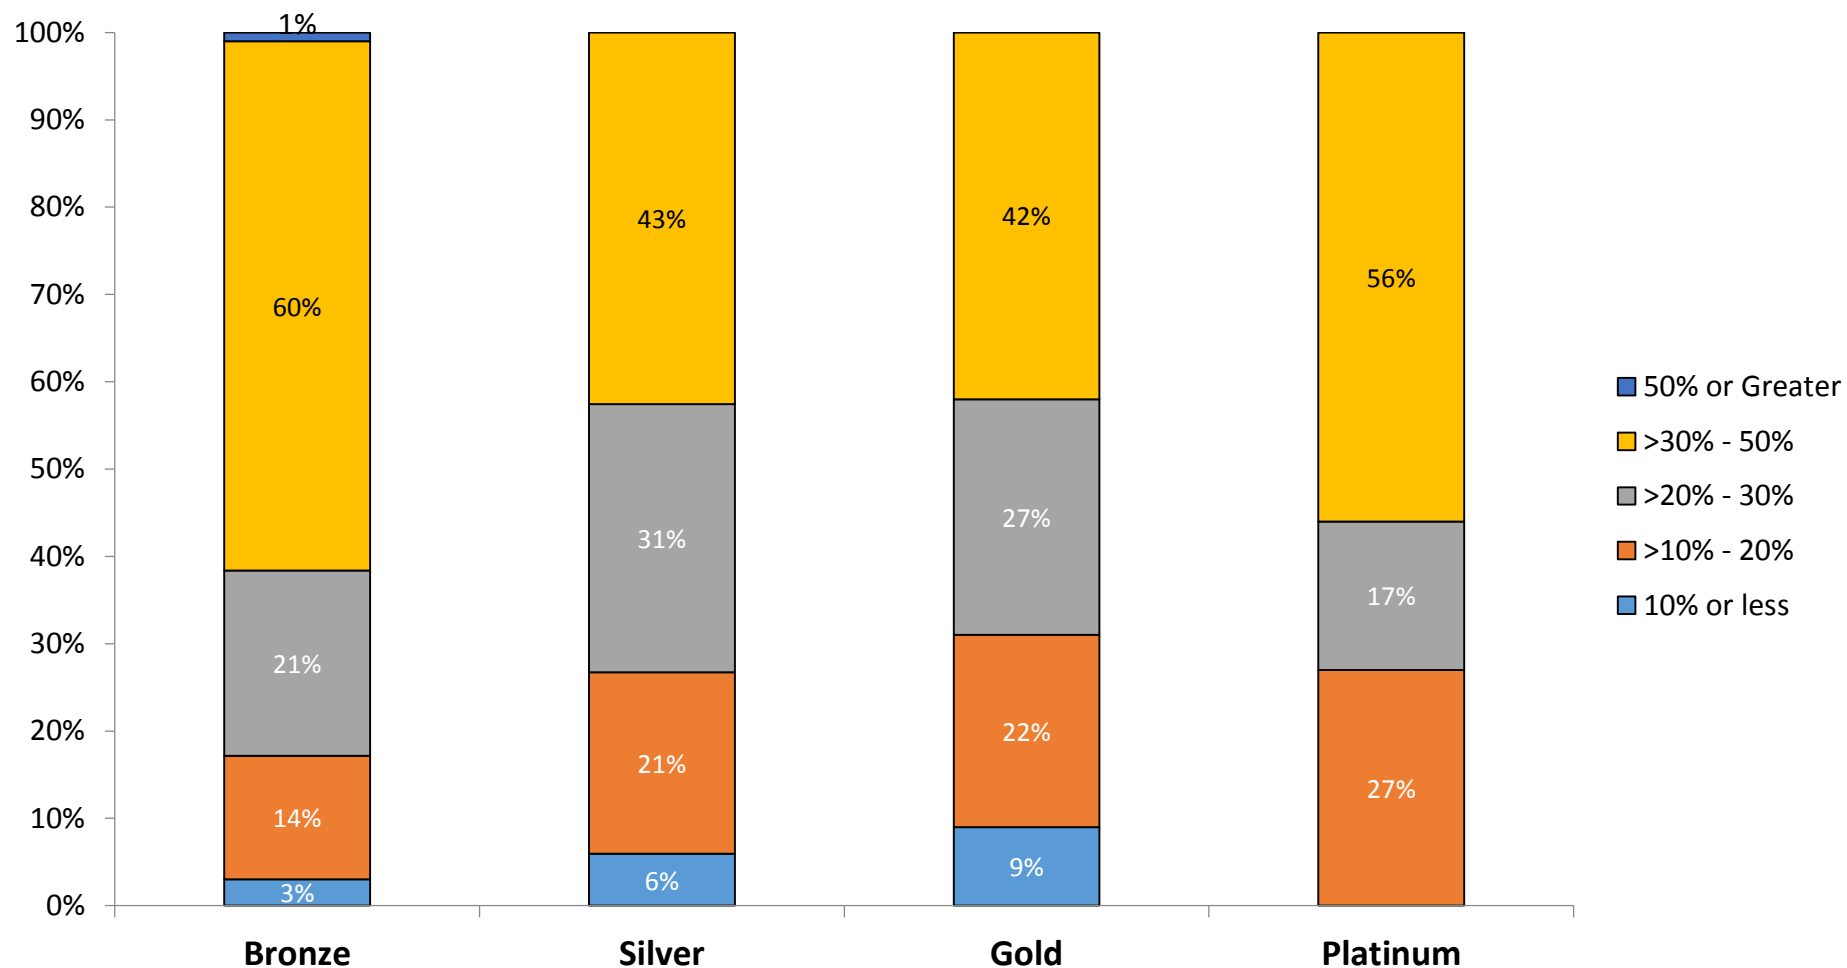

Distribution of Copayment Amounts for Specialty Drugs (includes plans with 'copayment' or 'both copayment & coinsurance')

Average Coinsurance Rates for Specialty Drugs (includes plans with 'coinsurance' or 'both copayment & coinsurance')

Distribution of Coinsurance Rates for Specialty Drugs (includes plans with 'coinsurance' or 'both copayment & coinsurance')

Most Americans favor action to keep drug prices down

Percent who say they favor each of the following in keeping prescription drug costs down:

Policy Solutions Are Needed

- As policy makers and insurers search for ways to control cost growth, they have frequently turned toward cost-sharing as a cost-containment mechanism.
- Recent data show that insurers and, subsequently, employers, have steadily shifted the cost of healthcare to beneficiaries
- A literature review in 2012 found that increases in cost sharing led to decreases in medication adherence.

Association between Cost Sharing and Disease Modifying Treatments (DMTs) in Multiple Sclerosis

Objective:

To explore the existence of a classic economic concept: willingness to pay (WTP) threshold for DMT utilization and adherence.

Hypothesis:

MS patient are insensitive to the OOP payment if their OOP payment is below the WTP threshold, while the health outcomes may be compromised above the WTP threshold.

- Y axis is the change of the probability for using DMT
- X axis is the annual OOP payment.
- A flat line from 0 can be observed until the OOP payment reached to a certain threshold, and then the probability of initiating DMT decrease as the OOP keep rising.

Existence of the WTP threshold for DMT utilization.

- Existence of the WTP threshold for DMT adherence

Coupon Policy In Private Sector

Starting from 2010, there was an sharply spreading trend for the coupon policy offered by major DMTs manufacturers (e.g., Copaxone, Betaseron, Tysabri, etc.)

Before 2010

After 2010

SOLUTION 1: POOLING WITH OTHER DRUG TYPE

- A recent actuarial analysis (2013) indicated that the cost of eliminating Medicare Part D specialty tiers could be offset by implementing relatively modest increases in traditional 3-tiered co-payment.
- It is a rational strategy for the private insurance company follows similar logic and try to shift the copay amount from MS DMTs to other common drug classes under the same health plan, as it will be likely to cause only a modest increase in their copays, considering MS as rare disease in the US population.
- A small increase in copay for common drugs is unlikely to discourage the drug initiation, as the cost-sharing component is very low in those drug class.
- *However, what/how to do, given that specialty drug category is projected 1/3 total Rx cost?*

SOLUTION 2: VALUE-BASED INSURANCE DESIGNS

- Currently, the main stream of drug cost sharing plan such as Medicare part D policies is one-size-fits-all, wherein cost sharing is directly a function of the medication cost.
- However, the number of value-based insurance design is increasing: in 2017, the CMS will be initiating the Medicare Advantage Value-Based Insurance Design (VBID) model in seven states: Arizona, Indiana, Iowa, Massachusetts, Oregon, Pennsylvania, and Tennessee, and it may keep expanding to other states over time.
- *Is there any value difference? What is the value framework?*

State Efforts to Reduce Cost Sharing for Rx

- Monthly caps on drug costs:
 - California (all Rx)
 - Delaware, Louisiana, and Maryland (specialty tier)
- Annual cap on drug costs: Maine and Vermont
- Limiting formulary flexibility: New York (prohibit specialty tier)
- Health plan benefit design (using copayment instead of coinsurance)

Summary

- High-cost drugs can impose a crushing burden on some of our sickest, most vulnerable citizens.
- Caps on cost-sharing aim to ease this burden and help people access critical treatments by spreading some of the costs across healthy and sick alike.
- As debate over how best to manage this trade-off continues, the experiences of states taking early action should be closely monitored.
